

Gema System Architecture

Gema is a web based system utilising Microsoft.NET and Microsoft SQL Server. Teamed with Netguides superior business hosting it provides an extremely secure and reliable business system solution.

Netguides Business Hosting

Netguides superior business hosting

Netguides provide Gema as a fully hosted solution on their own dedicated servers. These are housed in Rackspace's London data centres and backed up by Rackspace's award winning 24/7 Fanatical support.

We provide a range of hosting packages from your own dedicated machines to sharing machines with other Netguides clients. Netguides manage the share so all clients get the service they require at a much lower price. This allows us to offer you the quality of hosting you would get with a dedicated server while you are growing your business and a seamless upgrade path when you require a more powerful solution.

Netguides can truly provide a 'one stop shop' for all your system, web, search engine optimisation and hosting needs.
